

Providing high density file storage in limit space

Archipelago - Malaysia

Having moved into beautiful new modern open plan offices, the company found they were short of the required space needed to store client files. Having then created a designated storage room for filing, they realized they had insufficient space to store the required number of files, which also meant they had no room to grow. The solution was to install Fortisco Mechanically Assisted mobile shelving units. Initially, it was thought that just twelve bays of shelving would be required to meet the current demands. However, Fortisco proposed a solution that would not only provide the required storage capacity in less than 50% of the available area, but would also cater for the required future expansion.

By installing the shelving the length of the room rather than the width, Fortisco were able to offer Archipelago the most cost effective as well as efficient solution as the number of mobile trolleys and drive mechanisms can be reduced. The floor was installed without the need to fix to, or damage, the existing office floor

Ergonomically designed hand cranks with and without locking mechanism

The floor panels are supported by mobile rails that form a solid platform that do not require fixing to the existing floor.

Fortisco were able to personalise the installation by providing Archipelago with high quality end panels preprinted with their companies' logo.

The high quality, high-density shelving provides Archipelago with a clean, aesthetically pleasing, secure and efficient storage solution for their client files. As per all Fortisco installations, load and safety notices along with operating instructions are provided.
